

DATA ANALYTICS PROCESS

Description

We use Data Analytics in everyday life without even knowing it.

For Eg : Going to theatre to watch a movie.

1. **PLAN:** We first decide which movie I need to watch before going to theatre. Is it a Hindi, English or any other language movie.
2. **PREPARE:** Next I need to check how much I am willing to spend and how to get that money.
3. **Process:** Then I need to check how much I want from the data. Like if I am going to watch a Hindi movie then I need to check what movies are playing at the theatre.
4. **Analyze:** Obviously I won't be going to that movie which is not running well. Also I need to check the ratings and the review factors of the movie.
5. **Share:** Now after all this I will be definitely going to communicate this thing with my friends and take some advice from them .
6. **Act :** Then finally come to a conclusion and decide to watch a particular one and then buy the ticket price.
